

#### Changes in Ver 1.3e

- o Version 1.3e.  
Termination data can be specified for each channel.  
One can specify "No Data". If the data to be interleaved is XA-ADPCM data and your program expects video data as termination data, then one should specify "Video sector" and its length. If you need null sectors after channel data, you can specify "Null sector" and its length. The unit for length is 1 sector.
